Active Weather Warnings, Watches and Advisories by County:

WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

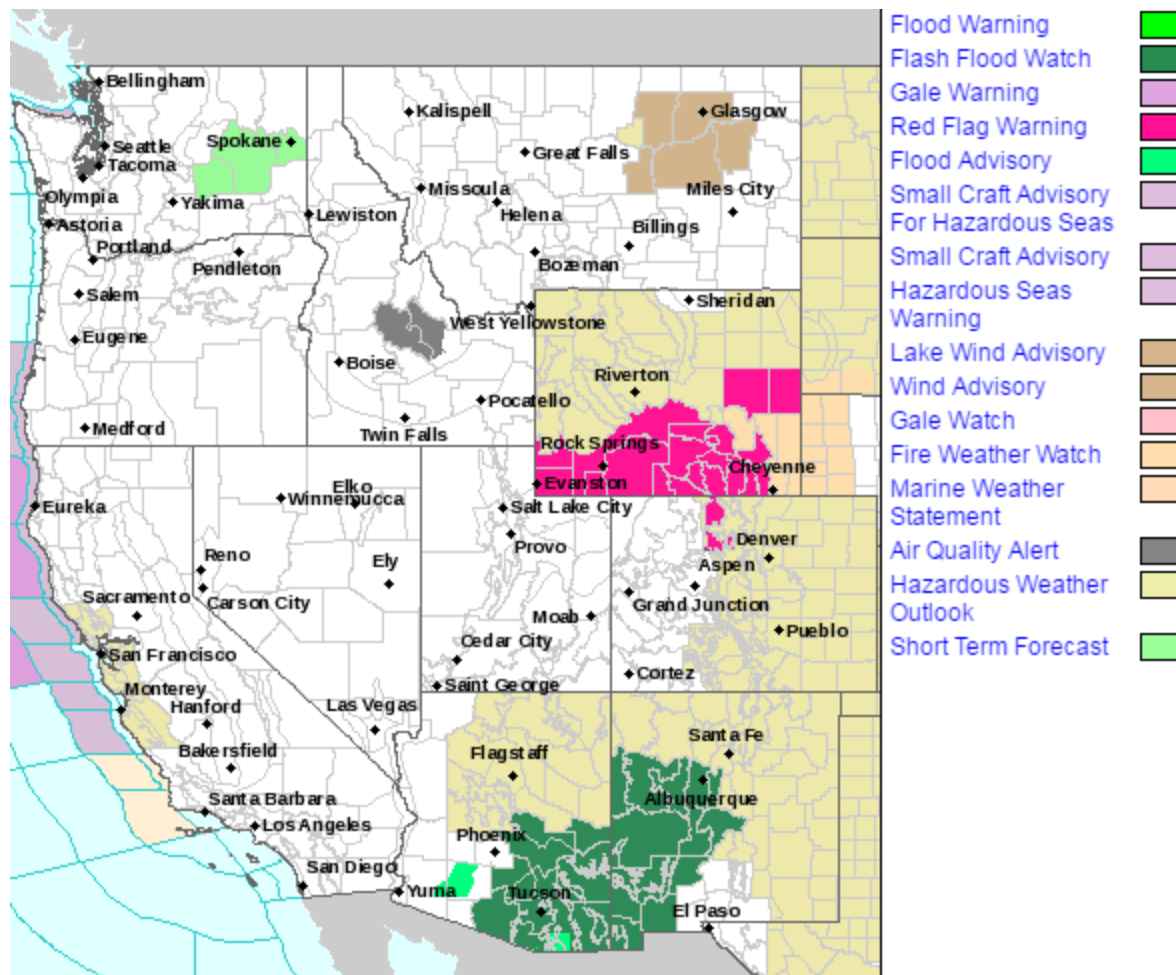

The region will remain under a dry northwest flow through Friday, sandwiched between strong high pressure over the eastern Pacific and a low pressure trough over the Rocky Mountains. A zonal (west-to-east) flow will be in place over the weekend as a Pacific northwest low pressure trough slowly moves southward. There will be a few scattered mid and high clouds toward the Oregon state line today, but showers or thunderstorms are unlikely. A warming trend will bring afternoon temperatures to 5-10 degrees above normal today through Sunday. During nights and mornings through Sunday, dry surface north to northeast winds will gust to 20-25 mph and locally higher in the Sacramento Valley/foothills, and on the mid and upper slopes in far northwest California. Poor overnight relative humidity (RH) recovery (20-40%) will become more widespread each night. Afternoon humidity in many inland areas will be 8-15%. A shallow marine layer will only affect areas along the immediate coast. On Monday a front will drop into the region from the north. The front will stall over the region late Monday and a closed low will form along the front over northeast CA. Isolated showers and thunderstorms are possible from the Cascade-Sierra crest east Monday and Tuesday. Dry northeasterly winds will prevail over a large portion of the region Monday and Tuesday, with gusts reaching 20-30 mph. Humidity will be low, and poor overnight RH recovery will be common. Temperatures will cool to 5-10 degrees below normal.

SOUTHERN CALIFORNIA

Weak ridging is expected to continue across the area the rest of the week, resulting in mostly sunny skies with light winds. Only subtle day-to-day changes in the weather and temperatures are expected to remain within a few degrees of normal each day through Saturday. In general, highs will be in the 70s along the coast, lower to mid 90s in the valleys to 105 in the desert. The air mass will continue to be quite dry above and inland from the marine layer and minimum relative humidity (RH) will drop into the 8-12% range from 3,000 to 6,000 feet for 3-5 hours each afternoon. Light winds and clear skies should allow for good recovery at night. Next week, a deep trough is expected to drop from the Northern Rockies into the northern part of the state, bringing windy and cooler weather. Gusty southwest winds will likely develop in the deserts Monday with windy weather spreading to the rest of the area Tuesday. Isolated showers may develop in the Sierras next Tuesday and Wednesday. The rest of the area will see a deep marine layer and temperatures 10-15 degrees below normal early next week.
